This comprehensive guide for mental health practitioners and medical professionals addresses the delicate issues surrounding breast cancer and the processes involved in emotional coping and healing. The book covers concerns of family members as well as women worried about developing breast cancer.

This comprehensive guide for mental health practitioners and medical professionals addresses the delicate issues surrounding breast cancer and the processes involved in emotional coping and healing. The book covers concerns of family members as well as women worried about developing breast cancer.

In Meeting Psychosocial Needs of Women with Breast Cancer, the National Cancer Policy Board of the Institute of Medicine examines the psychosocial consequences of the cancer experience. The book focuses specifically on breast cancer in women because this group has the largest survivor population (over 2 million) and this disease is the most extensively studied cancer from the standpoint of psychosocial effects. The book characterizes the psychosocial consequences of a diagnosis of breast cancer, describes psychosocial services and how they are delivered, and evaluates their effectiveness. It assesses the status of professional education and training and applied clinical and health services research and proposes policies to improve the quality of care and quality of life for women with breast cancer and their families. Because cancer of the breast is likely a good model for cancer at other sites, recommendations for this cancer should be applicable to the psychosocial care provided generally to individuals with cancer. For breast cancer, and indeed probably for any cancer, the report finds that psychosocial services can provide significant benefits in quality of life and success in coping with serious and life-threatening disease for patients and their families.

"This publication is a testament to how far the field of genetic counseling for breast cancer susceptibility has advanced since the mid-1990s, following the cloning of two major breast (and ovarian) cancer susceptibility genes, BRCA1 and BRCA2. For women who test positive, several recent studies confirm what we suspected early on namely that prophylactic mastectomy and oophorectomy confer significant protection against the development of breast and ovarian cancer. Ongoing research to develop better screening measures for ovarian cancer is especially critical now given the substantial number of women who are identified by BRCA1/2 positive status as being at high risk for this disease. In addition, we are learning more about other genetic contributions to familial breast cancer risk including low penetrance gene mutations, SNPs (single nucleotide polymorphisms) and mutations in modifier genes. In this continuum of learning and awareness, it is the shared efforts of policy-makers, researchers, healthcare providers, theologians, ethicists, consumers, and others who will navigate us through and beyond the genetics nexus. As a community, we have a window of opportunity to embrace lessons learned from cancer genetic counseling and extrapolate them to other pursuits of genetic knowledge."

Adjuvant treatment is administered prior to or as follow up to surgical procedures for breast cancer. Proven success in using medical therapies allowing for breast conserving procedures or reducing risk of occurrence. Although there has been much progress towards a cure, including the introduction of new targeted therapies, metastasizing cancer remains highly incurable.

I was looking at Mrs T – all 45 kilos of her – with somewhat puzzled thoughts. I had prescribed her capecitabine at very prudent doses, in view of her 91-year-old kidneys and physiology. She had reduced my treatment even further, " because it was making her tired. " As a result, she was taking a grand total of 500 mg of capecitabine a day. Yet, her metastatic, ER/PR-negative, Her2-positive breast cancer was undoubtedly responding. Her pain was improving and her chest mass was shrinking, as were her lung metastases... What was the secret of that response? Were Mrs T 's kidneys eli- nating even less drug than predicted by her creatinine clearance? Was her sarcopenia altering drug distribution? Was she absorbing more drug than average? Or was her tumor exquisitely sensitive to fluoropyrimidines? " Physicians, " said Voltaire, " pour drugs they know little for diseases they know even less into patients they know no- ing about. " Medicine has made tremendous progress since the eighteenth century. Yet, there are fields where quite a lot remains to be learned. In developed countries, 25% of breast cancers occur in patients aged 75 years and older. Yet, these patients represent only 4% of the population of traditional clinical trials. That ought to let us wonder how relevant data acquired in patients in their 60s are to a nonagenarian. Fortunately, geriatric oncologists have been stepping up to the task and have gen- ated data to help us to treat such patients.

Experienced oncology nurses address all the issues surrounding women 's cancers. This edition offers new data on the long-term effects of cancer and its treatment, as well as updates on genetic influences, environmental factors, and analysis of complementary and alternative therapies. 70 black-and-white illustrations are included.

An authoritative work that provides a detailed review of the current status of cancer prevention and control practice and research. This volume is an essential reference guide and tool for primary care physicians, the research community and students. Written as a collaborative work by the faculty of the nationally renowned Cancer Prevention and Control Program at the Arizona Cancer Center, this book brings together the expertise of specialists in the field of cancer prevention and control to provide the medical and research community that does not specialize in this field with insight to the disciplines of cancer prevention and control.

This authoritative work, now in its fourth edition, presents state of the art knowledge on all key aspects of cancer prevention. In addition to detailed summaries on preventive strategies for specific cancers, readers will find current knowledge on a range of relevant scientific topics including the benefits of cancer prevention, the importance of diet and physical activity, innate and adaptive immune responses to cancer, hereditary risks, cancer health disparities, and the preventive role of telemedicine. In this new edition of the book, the coverage has been expanded to include additional disease sites and to provide up-to-date information across the range of disciplines in the field of cancer prevention and control. Written as a collaborative work by internationally recognized leaders in the field, Fundamentals of Cancer Prevention is an essential reference guide and tool for oncologists, primary care physicians, the research community, and students with an interest in reducing the burden of cancer through the implementation of effective preventive strategies.

Elizabeth Williams draws on the perspectives of womanist theology and anthropology to examine how Black, American women use faith to achieve well-being after a breast cancer diagnosis. Williams portrays how these women have constructed a cultural theology of breast cancer that draws on their experiences and worldviews.
