More Measurement Games Objective: I know how to convert between different metric measurements. Metric measurements of length are millimeter (mm), centimeter (cm), meter (m), kilometer (km).  $10 \text{ mm} = 1 \text{ cm}$   $100 \text{ cm} = 1 \text{ m}$   $1000 \text{ m} = 1 \text{ km}$ . Example (a) Change 0.27 km to m (b) Change 54mm to cm. Solution: (a)  $0.27\text{km} = 0.27 \times 1000\text{m} = 270\text{m}$  (b)  $54\text{mm} = 54:10\text{cm} = 5.4\text{cm}$

A unit of measurement is a defined magnitude of a quantity that it used as a standard for measurement for the same kind of quantity, such as measurements of length, weight, and volume. In the past, many systems of measurement were defined on a local level, and could be based on factors as arbitrary as the length of a king's thumb.

Metric measurements. A meter has been officially defined to be the distance traveled by light in a vacuum in  $1/299,792,458$  second. All other length and distance measurements in the metric system derive from the meter (eg.  $\text{km} = 1000\text{m}$ ,  $1\text{m} = 1000\text{mm}$ ). Imperial / American measurements. These measurements have a less logical progression.

Metric measurements are units which measure mm, cm, m and km. Find out more about measuring in this Bitesize KS2 Maths guide.

What are metric measurements? - BBC Bitesize

Formula: miles \* 1.609344 = km. Calculation: 25 miles \* 1.6093 = 40.2336 km. End result: 25 miles is equal to 40.2336 km. As you can see in certain scenarios the conversion is quite easy to do by doing the math by hand, but in others a unit converter is definitely necessary.

The workbook Measurement Unit Conversions contains lessons and exercises suitable for grades 5-7. First, we study how the basic

concept of decimal numbers can help us convert measuring units. For example, since 0.01 means one-hundredth, then 0.01 m means one-hundredth of a meter -- which is the definition of a centimeter. Then we round and estimate quantities given in various measurement units, and find the error of estimation. After that, we focus on the metric system and conversions between the metric units of measurement. I have tried to emphasize sensible and intuitive methods for converting measuring units within the metric system, instead of relying on mechanical formulas. Next, we practice conversions between units in the customary system, using the basic conversion factors and multiplication and division. Then from there we advance to conversions between customary and metric measuring units. Later, students learn how rates can be used to convert measurement units. This method is in addition to the

methods for converting measurement units that were explained earlier in the workbook. It does not mean that students should "change over" and forget what they learned earlier - it is simply a different method for doing the conversions. Some students may choose one method over another; some may be able to master all of the methods. Most will probably choose one method they prefer for doing these conversions. Next, the lesson on maps gives a different real-world context for measurement units and conversions between them, since calculating the real distances from map distances or vice versa involves both using a scale ratio and conversion of the measurement unit used. Lastly, the lesson Significant Digits deals with the concept of the accuracy of a measurement and how it limits the accuracy of the solution. Significant digits is not a standard topic for middle school, yet the concept in it is quite important, especially
