About the Global VAR (GVAR) Modelling. The Global Vector Autoregressive (GVAR) approach, originally proposed in Pesaran et al. (2004) , provides a relatively simple yet effective way of modelling interactions in a complex high-dimensional system such as the global economy. Although GVAR is not the first large global macroeconomic model of the world economy, its methodological contributions lay in dealing with the curse of dimensionality (i.e. the proliferation of parameters as the dimension ...

The vector autoregression model (VAR), which is not to be confused with Value-at-Risk (VaR), is arguably the simplest and most often used multivariate time series model for forecasting. Consider a first-order VAR, call it VAR (1) $R_t = \alpha + \beta R_{t-1} + \epsilon_t$, $Var(\epsilon_t) = \Sigma$, where R_t is again a k by 1 vector of variables.

Vector autoregressive (VAR) models. A p -th order vector autoregression, or VAR(p), with exogenous variables x can be written as: $y_t = \alpha + \beta_1 y_{t-1} + \beta_2 y_{t-2} + \dots + \beta_p y_{t-p} + B_0 x_t + B_1 x_{t-1} + \dots + B_p x_{t-p} + u_t$, where y_t is a vector of K variables, each modeled as function of p lags of those variables and, optionally, a set of exogenous variables x_t .

A variable is a value assigned to an identifier, so you can reference and use it later in the program. This is because JavaScript is loosely typed, a concept you'll frequently hear about. A variable must be declared before you can use it. We have 2 main ways to declare variables.
